

Hosting and Connected Platforms – GoGame

Hosting Platform

We're planning to use the [Hostinger Cloud Startup](#) plan to host both the main website and the dashboard (backend + database).

Below are the main technical specifications and features included in this plan:

- 3 GB RAM / 2 CPU cores – suitable for websites with moderate traffic and dynamic content.
- Dedicated IP address for better performance and security.
- Full support for Node.js, Express, PHP, Python, and MySQL, so both frontend and backend can run on the same server.
- Unlimited SSL certificates (HTTPS enabled).
- Domain registration.
- Daily automated backups.
- SSH & FTP access for secure deployment.
- 24/7 technical support.

We believe this setup should be sufficient for our current and near-future needs, but please confirm if it's compatible with your development environment or if you would recommend any additional configuration or different hosting approach.

Connected Platforms

In addition to the hosting setup, the following external platforms will be connected to the GoGame website:

- [Stripe](#) – for processing secure online payments directly through the booking form.
- [WhatsApp Business](#) – for customer communication and post-booking support, linked via a button or chat widget on the website.
- [Social Media Integrations](#) – including TikTok and Instagram, mainly for brand visibility, redirection links, and social proof.

Please let us know if all of this works well with your backend implementation plan, or if you'll need any specific configurations from our side.
